BASR signed an agreement with the Arab Bank to receive the most advanced “Vertigo Test Machine” in Palestine that can be used to perform “Videonystagmography and Electronystagmography testing” for determining the causes of dizziness and balance disorders, thus rendering all needed diagnostics to children and adults with Vertigo related problems from different areas in Palestine.

The test machine includes a complete diagnostic system for recording, analyzing and reporting of eye movements, using video imaging technology, to track different kinds of symptoms including dizziness or vertigo, light-headedness, imbalance and nausea.

The donation comes as part of BASR's wide collaboration with the Palestinian private sector through its Corporate Social Responsibility Programs, including that of the Arab Bank “Together”, in order to promote quality health care services to all Palestinians including persons with disabilities.
